- Experimental difficulties
- Motivation: α -induced reactions on ^{168}Yb
- Activation method
- Experimental results:
 - $^{168}\text{Yb}(\alpha, n)$ - Cologne clover setup
 - $^{168}\text{Yb}(\alpha, \gamma)$ – LEPS @ ATOMKI
- Summary

Experimental difficulties for p -process studies

- number of reactions too large to measure all of them (≈ 20.000)
- many reactions on radioactive nuclei not easily accessible
- measurement inside Gamow window often below Coulomb barrier
 \Rightarrow small cross sections $\Rightarrow \sigma \approx \mu\text{b}$
- e.g. for $^{168}\text{Yb}(\alpha,\gamma)$: $E_{\text{Gamow}} \approx 8 - 11 \text{ MeV} \ll E_{\text{coul}} \approx 24 \text{ MeV}$

Experimental difficulties for p -process studies

- number of reactions too large to measure all of them (≈ 20.000)
- many reactions on radioactive nuclei not easily accessible
- measurement inside Gamow window often below Coulomb barrier
 \Rightarrow small cross sections $\Rightarrow \sigma \approx \mu\text{b}$
- e.g. for $^{168}\text{Yb}(\alpha,\gamma)$: $E_{\text{Gamow}} \approx 8 - 11 \text{ MeV} \ll E_{\text{coul}} \approx 24 \text{ MeV}$

calculations with Hauser-Feshbach statistical model necessary

- to calculate reaction rates, if no experimental data is available
- to extrapolate the data towards smaller energies, if experimental data is available above the Gamow window

Experimental difficulties for p -process studies

- number of reactions too large to measure all of them (≈ 20.000)
- many reactions on radioactive nuclei not easily accessible
- measurement inside Gamow window often below Coulomb barrier
 \Rightarrow small cross sections $\Rightarrow \sigma \approx \mu\text{b}$
- e.g. for $^{168}\text{Yb}(\alpha,\gamma)$: $E_{\text{Gamow}} \approx 8 - 11 \text{ MeV} \ll E_{\text{coul}} \approx 24 \text{ MeV}$

calculations with Hauser-Feshbach statistical model necessary

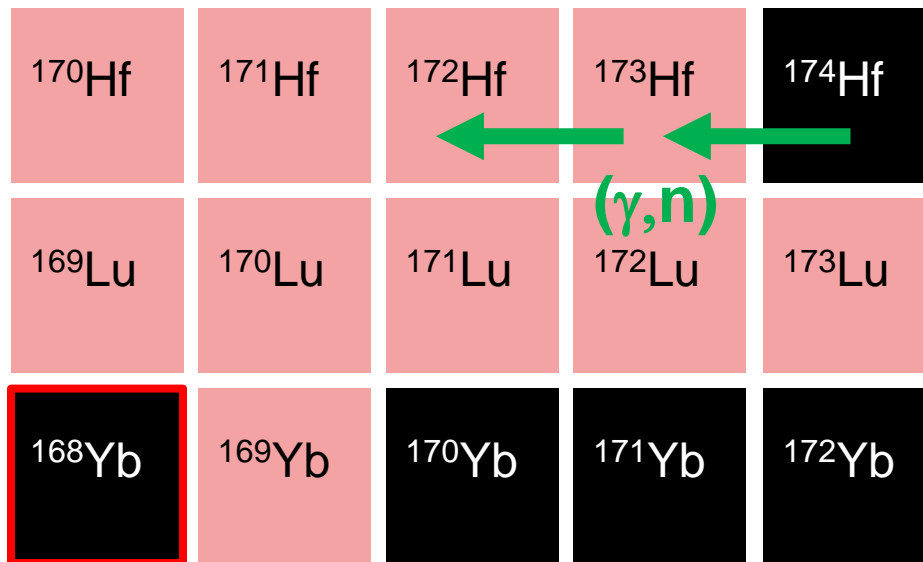

- to calculate reaction rates, if no experimental data is available
- to extrapolate the data towards smaller energies, if experimental data is available above the Gamow window

improvement of nuclear models to calculate reaction rates

- nuclear masses
- properties of excited states
- nuclear level densities
- γ -strength functions
- optical model potentials (OMP)

α -induced reactions on ^{168}Yb

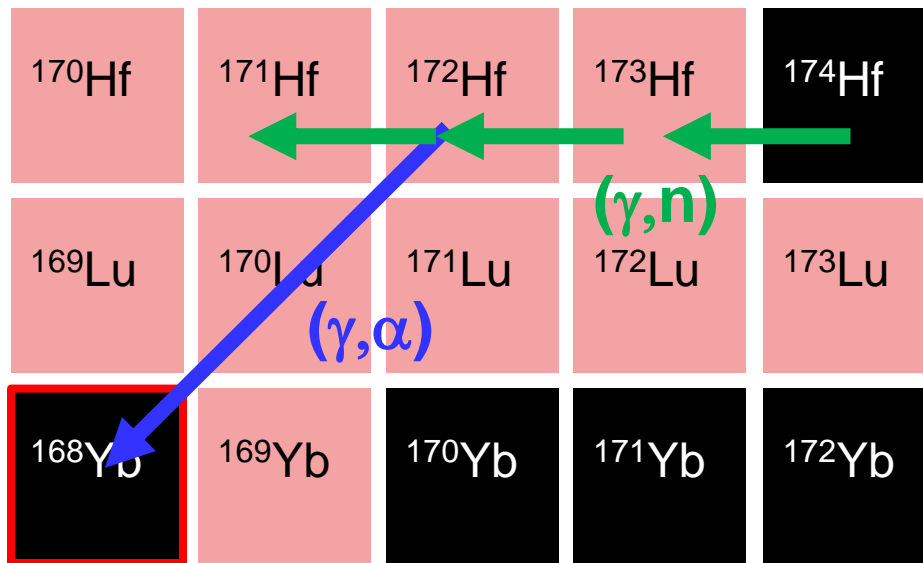

- Motivation: branching point in γ -process reaction flow predicted at ^{172}Hf

T. Rauscher, Phys. Rev. C 73 (2006) 015804

α -induced reactions on ^{168}Yb

- Motivation: branching point in γ -process reaction flow predicted at ^{172}Hf

T. Rauscher, Phys. Rev. C 73 (2006) 015804

α -induced reactions on ^{168}Yb

- Motivation: branching point in γ -process reaction flow predicted at ^{172}Hf

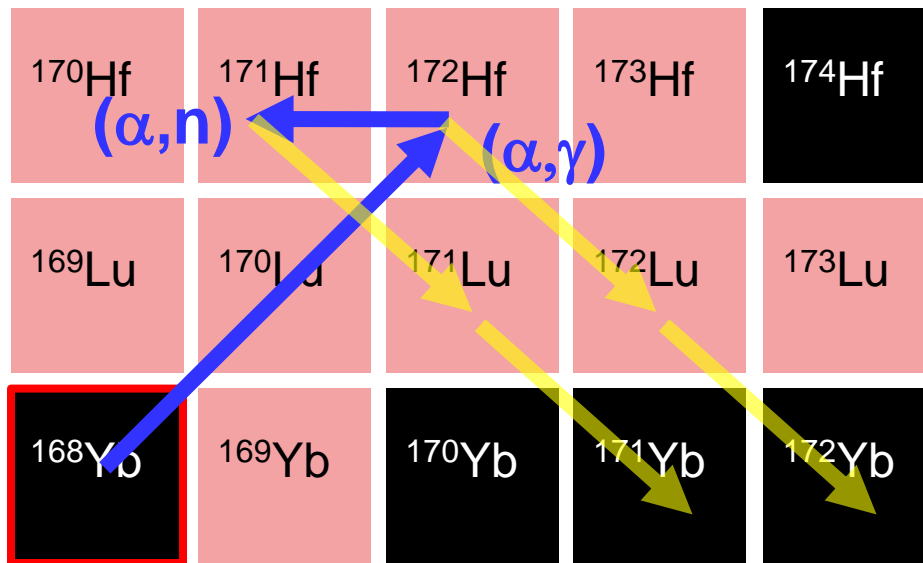

- stellar effects smaller for inverse reaction
- weak & low-energy γ -ray transitions for (α, γ) reaction

T. Rauscher, Phys. Rev. C 73 (2006) 015804

α -induced reactions on ^{168}Yb

- Motivation: branching point in γ -process reaction flow predicted at ^{172}Hf

Summary

- measured cross sections of α -induced reactions on ^{168}Yb
 - $^{168}\text{Yb}(\alpha, n)$ - Cologne clover setup
 - $^{168}\text{Yb}(\alpha, \gamma)$ - LEPS @ ATOMKI
- good agreement with theoretical calculations using modified Sauerwein / Rauscher α -OMP
- measurement below neutron emission threshold to draw unambiguous conclusions

$^{168}\text{Yb}(\alpha, X)$ – Modification of SR α -OMP

$$W = \frac{25\text{MeV}}{1 + e^{(0.9 E_C - E_{c.m.}) / a_E}}$$

$^{169}\text{Tm}(\alpha, x)$ – Modification of SR α -OMP

T. Rauscher *et al.*, Phys. Rev. C **86** (2012) 015804

Experimental situation

published experimental data within the
Gamow window*:

32 (p, γ) reactions

12 (α , γ) reactions

18 (α ,n) reactions
